### 1 RECORD OF REVISION

Revision Date	Page	Contents	Editor
2009/5/5	-	New Release	
2009/11/30	-	Add 7.0" WVGA	
2010/07/05	-	Modify command 0x80	

#### 2 Features

SSD1963 is a display controller of 1215K byte frame buffer to support up to 864 x 480 x 24bit graphics content. It also equips parallel MCU interfaces in different bus width to receive graphics data and command from MCU. Its display interface supports common RAM-less LCD driver of color depth up to 24 bit-per- pixel.

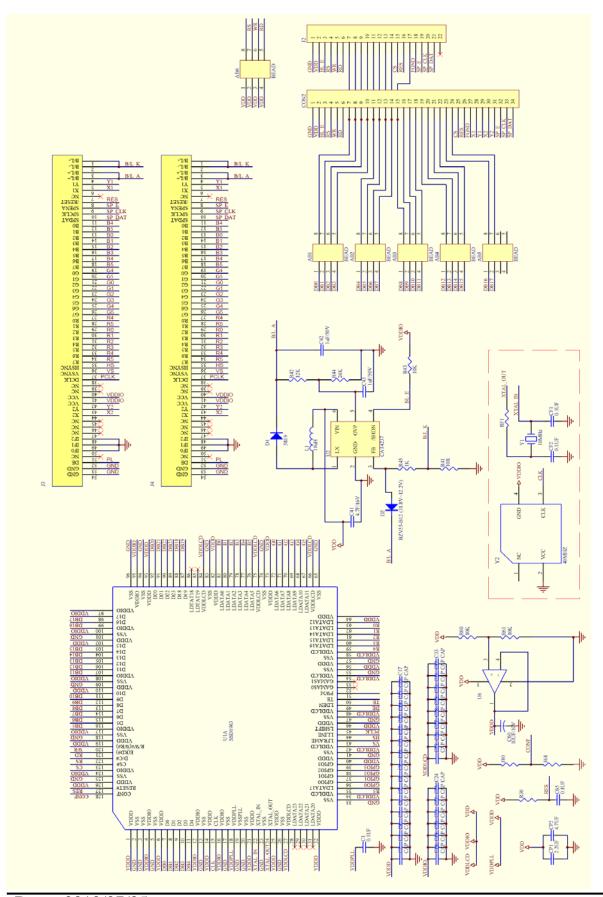

User can send a full screen picture by controlling the MPU with popular microprocessor interface :

16 bit 8080-Series MPU 8 bit 8080-Series MPU 16 bit 6800-Series MPU 8 bit 6800-Series MPU

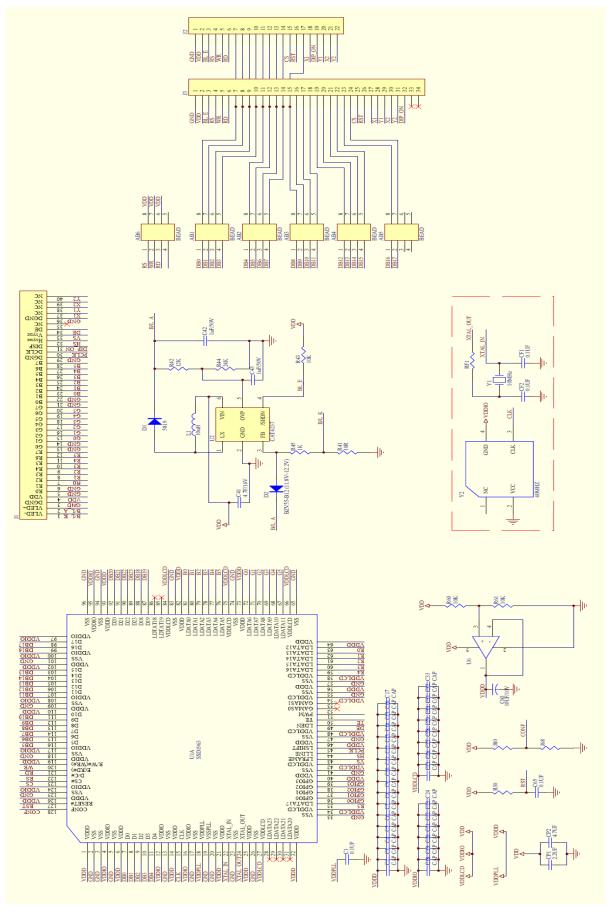

There are five kinds of control board include:

- # 4.3 inch WQVGA built-in LED driver
- # 5.7 inch QVGA built-in VCOM amplifier to adjust contrast and flicker by VR50/VR51.
- # 5.7 inch VGA built-in VCOM amplifier to adjust flicker by VR31.
- 第 7.0 inch WVGA.

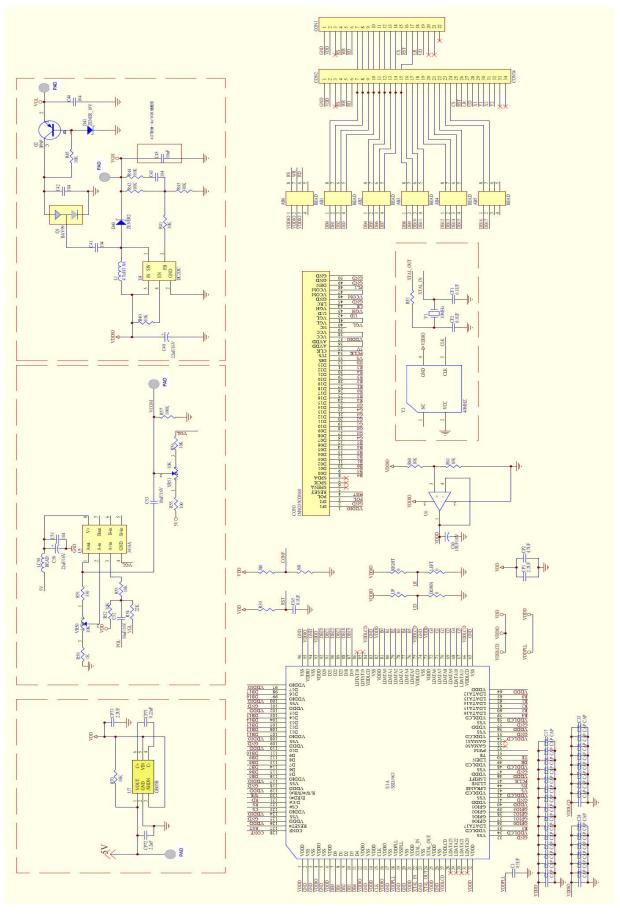

# 3.1 3.5 inch QVGA

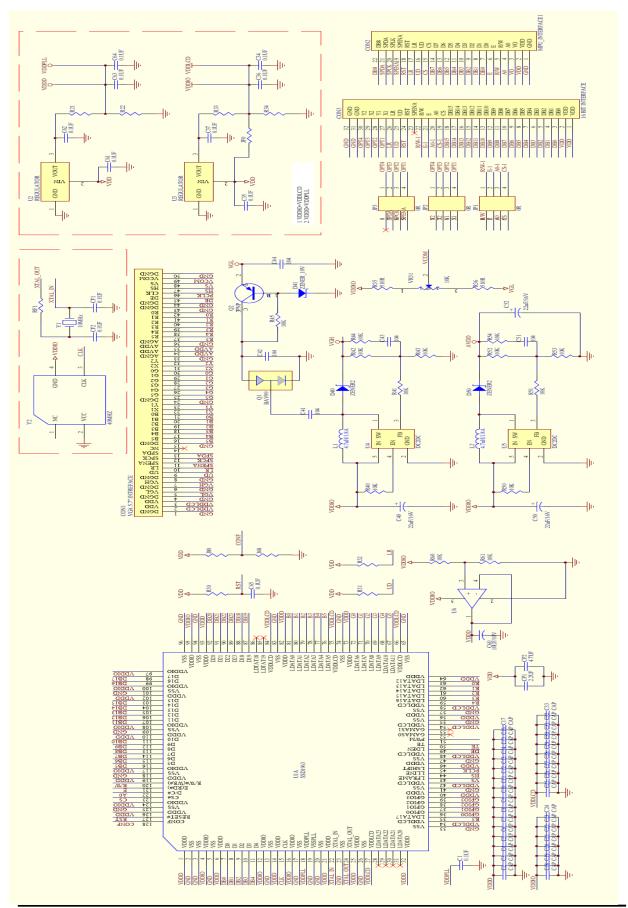

#### 3.2 4.3 inch WQVGA

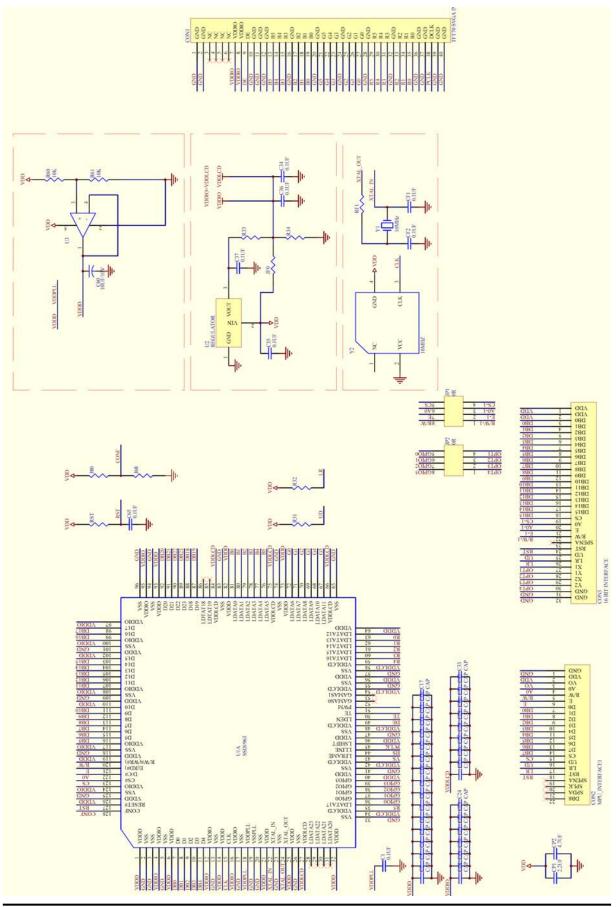

#### 3.3 5.7 inch QVGA

#### 3.4 5.7 inch VGA

#### **3.5 7.0** inch WVGA

#### **4.3** Pixel Data Format

Both 6800 and 8080 support 8-bit, 9-bit, 16-bit, 18-bit and 24-bit data bus of SSD1963, but only designed 8-bit and 16-bit data bus for all kinds of control board.

Depending on the width of the data bus, the display data are packed into the data bus in different ways.
